ABSTRACT OF THE DISCLOSURE

A system and method are provided for providing Internet addresses corresponding to an electronic signal, such as a video or audio program, to a user. The system includes a receiver for receiving at least one electronic signal, where the electronic signal includes one or more Internet addresses embedded therein. A decoder in communication with the receiver is operable to extract the one or more Internet addresses from the electronic signal. The system further includes a processor in communication with the decoder. The processor compiles a historical list of the one or more Internet addresses extracted from the electronic signal, and includes memory for storing the historical list. A web browser connected to the processor is operable to present the historical list of Internet addresses to the user.
